To build a simple convolutional neural network with Keras/TensorFlow.

**PROCEDURE:**

1. Download and load the dataset.
2. Perform analysis and preprocessing of the dataset.
3. Build a simple neural network model using Keras/TensorFlow.
4. Compile and fit the model.
5. Perform prediction with the test dataset.
6. Calculate performance metrics.

**PROGRAM:**

```
from tensorflow.keras.datasets import fashion_mnist

# Load the Fashion MNIST dataset
(train_images, train_labels), (test_images, test_labels) = fashion_mnist.load_data()
from tensorflow.keras.utils import to_categorical

# Reshape the images to add the channel dimension (28x28x1)
train_images = train_images.reshape((train_images.shape[0], 28, 28, 1))
test_images = test_images.reshape((test_images.shape[0], 28, 28, 1))

# Normalize the pixel values between 0 and 1
train_images = train_images.astype('float32') / 255.0
test_images = test_images.astype('float32') / 255.0

# One-hot encode the labels
train_labels = to_categorical(train_labels, 10)
test_labels = to_categorical(test_labels, 10)

from tensorflow.keras import layers, models
```

```
# Build the CNN model

from sklearn.metrics import confusion_matrix, classification_report
import matplotlib.pyplot as plt

# Generate confusion matrix
y_pred = predictions.argmax(axis=1)
y_true = test_labels.argmax(axis=1)
```

```
